

JS Challenge

Challenge Details:

YOUR MISSION

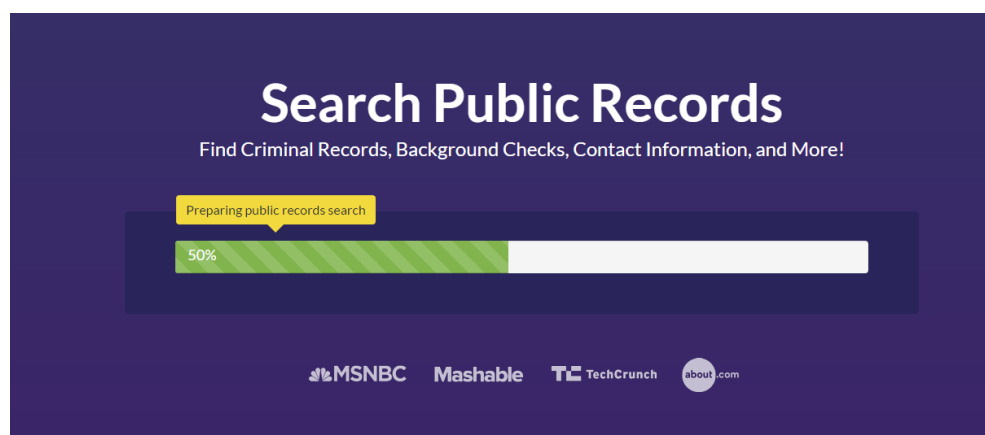

Your mission, should you choose to accept it, is to show your development skills by improving one of our marketing landing pages.

DETAILS

- A lot of our marketing traffic gets sent to pages like <https://www.beenverified.com/lp/ce4d67/1/landing>. For the test, we'd like to add a loading bar that gets initialized before the search bar appears.

WHAT TO DO

- Visit <https://www.beenverified.com/lp/ce4d67/1/landing> to familiarize yourself with the page, and then review the page code on the attached file.
- We'd like you to code in a loading bar that initializes as soon as you get to the page. Once the bar is complete, the search bar section will quickly fade back into place and someone can proceed to search.
- Here is an example of what we'd like the loading bar to look like.

- Specs for the loading bar:
 - It should last 5.5 seconds
 - The % number on the left should start from 100% and go down to 0% by the end.

- The loading bar should start slowly for the 1st third of time, then get quicker for the next third, and then get even quicker for the final third.
- This should also work on mobile. It is up to you how you implement the mobile design.
